# LiquiCapture™ Urine Collection Cups

Decreased risk of contamination. Greater efficiency.

**Designed With Harm Reduction in Mind.**

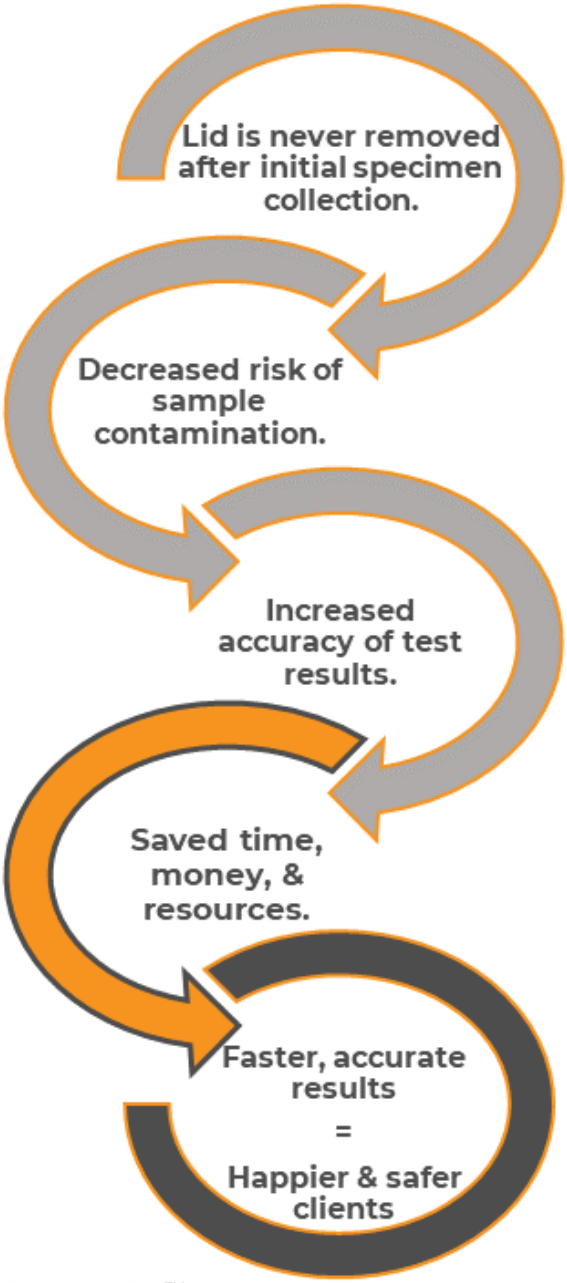
# Cups With Benefits

## Why Choose LiquiCapture™ Urine Collection Cups?

- Dip slot allows for mess-free insertion of drug test cards without removing the lid.
- Integrated transfer device allows extraction of smaller samples without removing the lid.

### Formats

- Integrated Dip Slot
- Integrated Transfer Device
- Combo Cup



- Use dip slot with drug test cards for an initial prescreen.
- Use integrated transfer device with collection tubes when offsite confirmation testing is needed.
- Add temperature strips to any cup to help identify instances of intentional specimen adulteration.

# Why Use the Combo Cup?

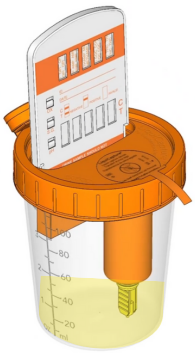
**No more unnecessary lab tests.**

- Save money.
- Save time.
- Save resources.

**Fewer opportunities for sample contamination and errors during transfer.**

**Drug Screening Required**

**Collect**



**Use Dip Slot With Test Card**

**Additional testing NOT necessary.**

**Results match self-reported drug use.**

**Positive**

**Inconclusive or inconsistent with patient's self-reported drug use &/or behaviour.**

**Negative**

**Results match self-reported drug use.**

**Additional testing NOT necessary.**

**Greater drug specificity required.**
e.g., positive for opiates, but which ones?

**Further lab testing required.**

**Withdraw smaller samples with integrated transfer device and collection tube.**

**Fill out patient label on tube.**

**Send tubes to lab.**

Add temperature strips to any cup to help identify attempts at adulteration.

- Tubes come with patient labels.
- Tubes are more space-efficient.
- Tubes cost less to ship.
- Less work for the lab techs.
- Specimen is already prepped for testing.

# Improve Operational Efficiencies

**Get accurate results faster.**

## Skip the Extra Steps & Get to What Really Matters

Before a sample can be tested, it must first be properly prepped and labelled. Transferring urine from a cup to a tube/vial or multiple tubes then ensuring each tube is labelled with the correct patient identification followed by disposal of a cup full of urine can be tedious. These preparatory steps take additional time to complete. This means clients and their patients must wait longer for results that could be time-sensitive.

### What if you could skip the prep steps?

LiquiCapture™ Urine Collection Cups can reduce time spent prepping specimen samples. With our integrated transfer device, your clients can send pre-filled, correctly labelled test tubes that are prepped and ready for testing. This means no more messy transferring of specimen samples from a cup to a test tube, less waste to dispose of, and more time saved. More time saved means results are delivered faster.

### Greater accuracy in test results means faster turnaround times.

It is very easy for foreign contaminants to enter a full urine cup with an open lid. Although procedural errors during specimen collection and certain substances can produce inaccurate results, there are easy ways to reduce the likelihood of sample contamination resulting from exposure to airborne particles. Once urine has been collected and the cap has been secured to the bottle, tests and specimen extraction can occur without ever removing the cap of a LiquiCapture™ cup. Less exposure to the surrounding environment, means fewer opportunities for airborne contaminants to mix with a given sample.

Fewer false positives/negatives, means tests do not have to be repeated and accurate results are produced faster.

# Products Specifications

- 100ml fill capacity
- Made from high density polypropylene (PP) plastic
- Leak resistant
- Shatterproof
- Temperature strips can be added to any cup
- Caps of choice are included with the cups

| Integrated Dip Slot | Integrated Transfer Device | Combo Cup |
|---|---|---|
| • Built in dip slot for insertion of drug test cards.<br>• Flip cup upside down so urine is collected in chamber. Return cup to upright position. Open flap to dip slot and insert test card. | • Use integrated transfer device with vacuum sealed collection tubes.<br>• Prepare smaller samples by inserting collection tube into transfer port and pushing down until desired amount of liquid has been extracted. | • Ultimate urine collection cup.<br>• Use dip slot with drug test card for initial prescreen.<br>• Use transfer device with tubes to extract samples for in-lab testing. |

**Benefits of using collection tubes:**

- Urine already transferred to testing vessel before lab.
- Lab receives urine samples already properly labelled (with patient QR code).
- Tubes are smaller than cups, take up less space, & cost less to ship.
